A little about
our backend

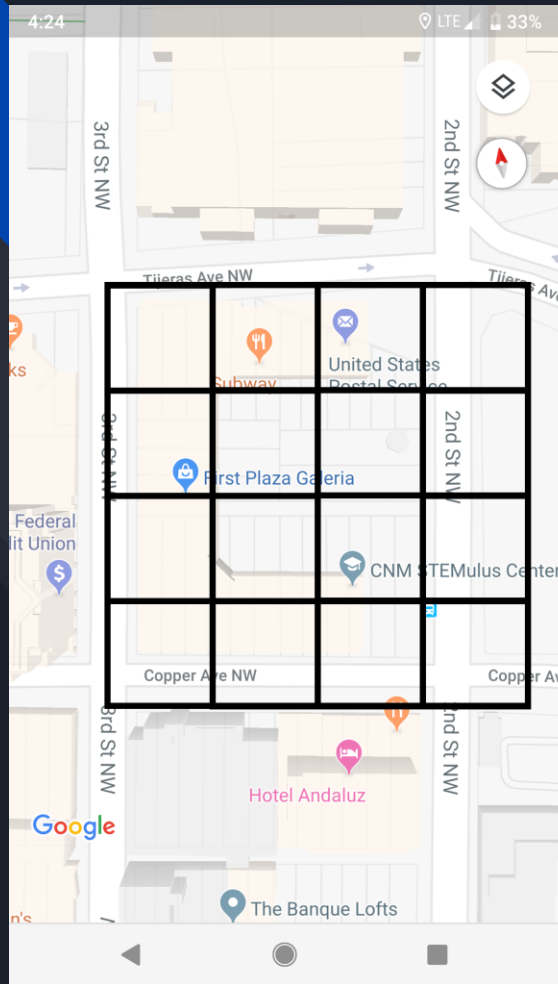

With Brian, our backend architect.

Sample Use Cases

1. Emergency beacon to neighbors.
2. Asking a cute person to a party or to coffee.
3. Invite coworkers to an office party, or meeting.
4. Invite people to go on a film tour.

Scalability Improvements

Single List Search Time: $O(n)$

- ❖ Complex calculations as part of the constant.
- ❖ Fast with small n value.
- ❖ Scales poorly as n increases; every user will be requesting this search 1-3 times a minute.

Squares and Vertices List Return: constant

- ❖ No complex spherical distance calculations.
- ❖ Essentially, presorts the Person objects into Squares.
- ❖ However, it requires a grid to be pre-made.

Security

- Google Oauth2 provider frontend
- JSON web token for backend verification
- Https server connections
- Room and Hibernate ORMs for communicating via prepared statements
